What is Claimed is:

1. A method capable of indicating a communication quality and being used in a network transmission system having at least a first station and a second station, comprising the steps of:

determining the communication quality of the network transmission system according to a data transmitted from the first station to the second station; and

indicating the communication quality at the second station.

- 10 2. The method of claim 1, wherein the communication quality is indicated at the second station using a video signal.
 - 3. The method of claim 1, wherein the communication quality is indicated at the second station using an audio signal.
 - 4. The method of claim 1 further comprising a step of:

issuing a signal to inform users if the communication quality falls below a threshold.

- 5. The method of claim 1, wherein the network transmission system further comprises a server capable of interrupting a data transmission between the first and second stations basing on the communication quality.
- 20 6. The method of claim 5, wherein the server is capable of recording the communication quality for future reference and inquiry.
 - 7. The method of claim 1, wherein the data comprises a plurality of packets enabling the second station to be able to evaluate the communication quality between the first and second stations according to the amount of the packets.
 - 8. A transmission system for network with communication quality indicating capability, comprising:
 - a first station, transmitting a data via a network;

25

a second station, receiving the data from the network;

5

15

25

a detecting unit, disposed at the second station for detecting a data receiving condition in real time, and computing a communication according to the same; and

an indicating unit, coupled to the detecting unit for indicating the communication quality at the second station.

- 9. The network transmission system of claim 8, wherein the communication quality is indicated at the second station using a video signal.
- 10. The network transmission system of claim 8, wherein the communication quality is indicated at the second station using an audio signal.
 - 11. The network transmission system of claim 8, wherein the network transmission system further comprises a server capable of interrupting a data transmission between the first and second stations basing on the communication quality.
 - 12. The network transmission system of claim 11, wherein the server is capable of recording the communication quality for future reference and inquiry.
- 13. The network transmission system of claim 11, wherein the detecting unit issues a signal to inform users if the communication quality falls below a threshold.
 - 14. The network transmission system of claim 11, wherein the data comprises a plurality of packets enabling the detecting unit to be able to compute the communication quality between the first and second stations according to the amount of the packets.
